Please enter the attached substitute Abstract of the Disclosure for that originally filed with this application.

ABSTRACT OF THE DISCLOSURE

The invention relates to an elliptical path exercise apparatus for simulating a hand-movement having a rotary body on a rear of a main frame and connected with one end of treadles on opposite sides thereof. The other end of each treadle is connected to an accessory rod of an adjusting mechanism driven by a motor. Both of the treadles move in an elliptical path and in an offset position. By a connecting mechanism, the two rocker arms move according to the treadles at the shaft for simulating a walking exercise on an uphill road or on a downhill road.
